Fed May Be Hiking in March, But Higher Rates Are Here Today

In the past 2 weeks, press coverage of the Federal Reserve's policy outlook has ramped up significantly. The Fed is now expected to start **hiking rates in March** and to hike more than previously expected in 2022. If you think that gives you time to get a mortgage before rates go up, think again.

While Fed policy has an impact on the entire financial market, the only major rate they control is the Fed Funds Rate--an overnight rate that applies to the shortest term borrowing between large financial institutions. That's a **distinctly different animal** than mortgage rates.

The Fed Funds Rate is currently expressed as a target range between 0% and 0.25% also known as the **lower bound** or simply "zero." In 2015, the Fed managed to embark on a series of hikes culminating in a 2.25-2.50% range by the end of 2018, but from 2009 through most of 2015, it was also at the lower bound.

Despite that, mortgage rates found a way to **jump by more than 1%** in less than 2 months in the middle of 2013 (a brutally fast move in the mortgage world). The culprit was the taper tantrum: the market's reaction to the Fed signaling that it was considering winding down (or "tapering") its rate-friendly asset purchases.

The most sincere tapering threats began in May 2013. Fed policy officially mentioned tapering on June 19. By the first week in July, the damage was done. It was **almost 6 months later** before the Fed officially announced the tapering plan, and almost another 2 years before they finally lifted rates from the zero lower bound.

National Average Mortgage Rates

	Rate	Change	Points
Mortgage News Daily			
30 Yr. Fixed	6.89%	0.00	0.00
15 Yr. Fixed	6.33%	+0.01	0.00
30 Yr. FHA	6.33%	+0.01	0.00
30 Yr. Jumbo	7.05%	0.00	0.00
5/1 ARM	6.58%	0.00	0.00

Freddie Mac

Recent Housing Data

		Value	Change
Mortgage Apps	Jul 10	206.1	-0.19%
Building Permits	Mar	1.46M	-3.95%
Housing Starts	Mar	1.32M	-13.15%
New Home Sales	Mar	693K	+4.68%
Pending Home Sales	Feb	75.6	+1.75%
Existing Home Sales	Feb	3.97M	-0.75%
Builder Confidence	Mar	51	+6.25%

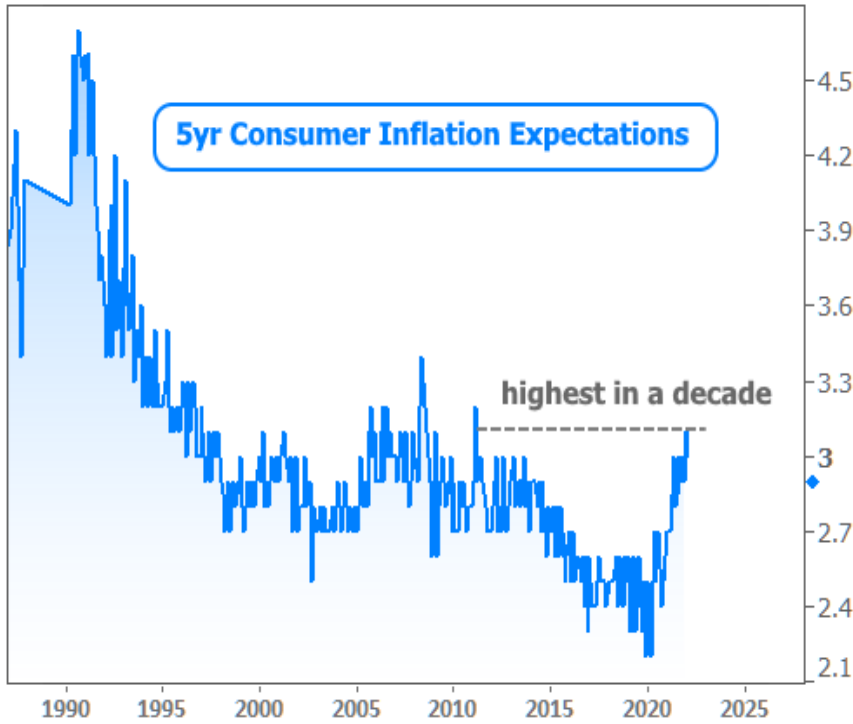

Things are **different** this time around, and we're **not** likely to see rates spike abruptly as they did in the past. But in relative terms, this winter is the modern day equivalent of the taper tantrum months in 2013. There was [plenty to discuss on this topic last week](#), which had already taken rates to their highest levels in nearly 2 years.

This week initially brought a brief **respite** from the chaos. Rates were slightly higher on Monday, but fell over the next 2 days. Thursday was mixed, but still strong enough to hold out hope that rates had found their near-term ceiling.

Then came Friday. It began with a sliver of hope. Retail Sales (an important economic report) came in weaker than expected. That's not good for the economy, but interest rates tend to benefit from bad economic news. Nonetheless, the bond market (which dictates rates) barely budged. One theory is that traders can look past month-to-month volatility when sales have been generally much higher than normal. Even now, the 12 month average of Retail Sales is 1.5%, roughly double the highest pre-covid levels.

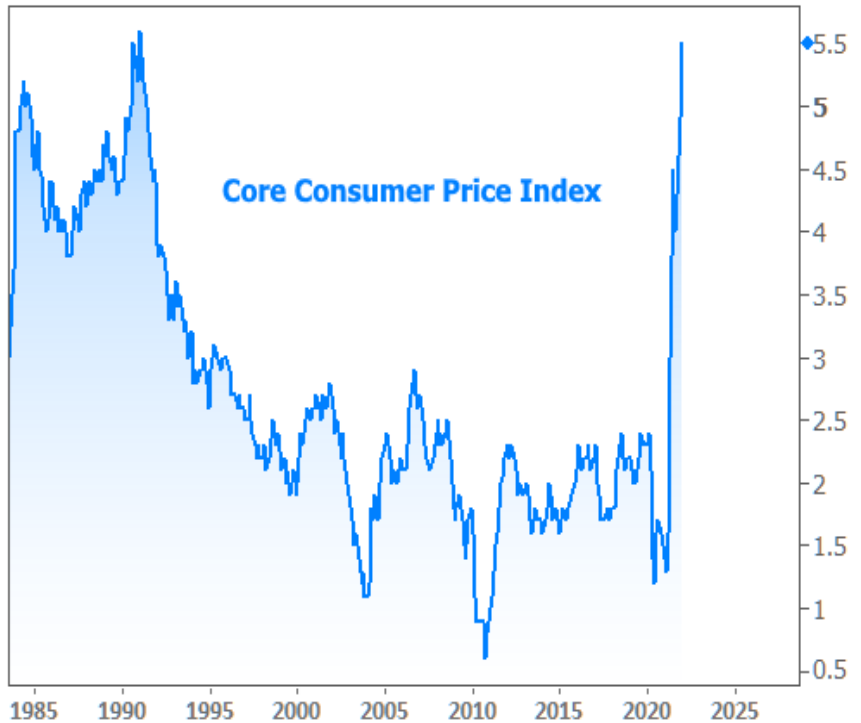

Caveats aside, there may not have been a low enough number to save rates. Traders are interested in other data because **the Fed** is interested in other data--specifically: **inflation**. 90 minutes after the Retail Sales data, the Consumer Sentiment Survey showed the highest inflation expectations in more than a decade. This is a metric the Fed often mentions as being important to the outlook.

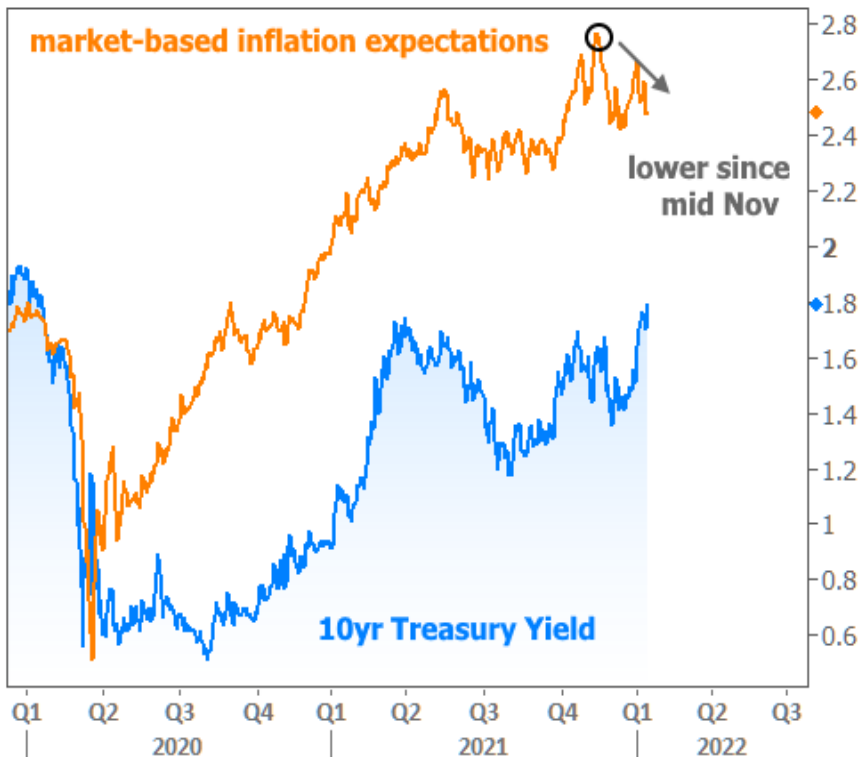

So was it the Sentiment data that tanked the bond market and sent rates screaming higher on Friday?

It probably didn't help, but it wasn't the culprit. After all, 2 days prior, the Consumer Price Index--one of the two biggest

inflation reports in the US--sent a similar message.

Despite the scary chart above, there very little bond market drama on Wednesday. Moreover, the most responsive gauge of inflation fear (market-based inflation expectations derived from bond trading) is well off November's highs. It didn't even increase after Friday's Consumer Sentiment data.

So why did rates spike on Friday?

This is actually a bit of a trick question. Rates have been rising in general since late 2020. The current rate spike really began last week. The first 4 days of the week were mostly a lull in the bigger picture. They had a chance to be the start of a bigger reversal, but ultimately revealed themselves to be a breath-catching exercise before more pain. **In other words, it was a trap-**at least for anyone hoping that rates would do something better than catch their breath.

The response is varied among mortgage lenders in terms of scope and timing, but on average, 30yr fixed rates are nearly 3/8ths of a point higher in the first 2 weeks of 2022. Even the notoriously stale but widely-cited Freddie Mac weekly rate survey **mostly** caught up to reality with their biggest jump since the start of the pandemic.

30yr Fixed Mortgage Rates

Is there any hope? Will rates continue higher and higher?

There's always hope. It's just a question of when it's justified. In the short term, optimists might consider that the Friday before 3-day weekends is often a day for big moves in the bond market that are subsequently moderated when traders are back in the office. Additionally, let 2013 serve as an example that the bond market is already doing its best to get ahead of future Fed moves. To be fair, that process may be far from over, but the point is that it has clearly been underway in various forms for quite some time.

In terms of events that will inform the outlook, after a bit of a lull next week, attention turns to the next Fed announcement on Wednesday, January 26th. This won't be a venue for any policy changes, but it will give the Fed a chance to update its official verbiage in light of recent market volatility, geopolitical risks, and the omicron surge.

Update: Buyer Broker Agreement

After requests from real estate companies, a nonprofit consumer watchdog group the Consumer Federation of America has developed a list of factors to consider when creating a buyer contract in preparation for upcoming practice changes in the industry.

CFA released its "Proposed Criteria for Evaluating Home Buyer Contract Forms" on Tuesday. The 15 criteria focus on the contracts' form – whether the documents are readable and understandable – and content – whether they are fair to homebuyers.

- the document's expiration date (CFA recommends buyers asks for a three-month contract and never sign one longer than six months)
- the right to terminate the contract
- the disclosure that compensation is negotiable
- the broker's compensation clearly stated and that the buyer broker can't receive additional compensation for facilitating a sale
- that any additional fees, such as for showing a home, will be deducted from the broker's commission if there is a successful sale
- that the commission is due only if there is a successful closing
- that buyers have an obligation – for no longer than 60 days, CFA recommends – to pay a broker who earlier showed them a home they purchased after the contract ended
- seller concessions paid directly to buyers
- dual agency not pre-approved by the contract
- an explanation of how a broker treats different buyer clients interested in the same property
- that buyers should not be required to first go through mediation or arbitration if they have a complaint
